

EMC People Platform Mobile App

UI/UX design specification and build brief. Employee self-service mobile app for attendance, leave, and profile, connecting to the existing People Platform v1.9.0 backend.

Emirates Mobility Company · Prepared for the development team

Build window: 2 weeks · **Backend:** connect to People Platform v1.9.0 (frozen contract)

Scope to build: Tier 1 + Tier 2 only · **Tier 3:** design reference, do not build backend

1. What this is, and what to build

A native mobile app for EMC employees. It does not contain its own HR logic - it is a client over the existing People Platform v1.9.0 backend. The design and the integration contract below are fixed, so the delivered app is consistent and compatible with the backend.

Build now - Tier 1 + Tier 2 (v1). Onboarding (Entra sign-in, device registration, consent), Home with punch, Attendance (records, day detail, corrections), Leave (balances, requests, status), Profile editing, Notifications, More/Privacy. These are the screens to deliver, working, in two weeks.

Tier 3 - design only. Payslips, Documents, Directory/Org chart, Manager approvals, AI assistant. Build the screens to the designs if time allows, but **do not build or assume backend** for these. Each needs its own specification first. They are included so the direction is visible, not to widen the two-week scope.

The integration contract (frozen)

- **Authentication is Entra ID.** The app signs the user in through the organization's Microsoft Entra ID. No app-specific password, no parallel login.
- **All authority is re-derived server-side.** Every action (punch, leave request, correction, approval) commits through the existing authenticated v1.9.0 endpoints, which re-check who the user is. The app never decides authority on its own.
- **No token-bearing actions.** A notification carries a deep-link that navigates to the request inside the authenticated app. It never carries the authority to action the request. A forwarded or intercepted link can do nothing.
- **Consume existing endpoints; introduce none that bypass the workflow engine.** Leave, attendance, correction, and approval all already exist server-side and enforce entity-scope and sequential approval. The app calls them; it does not re-implement them.
- **Synthetic data and dev-auth** are for UAT only and must not reach production. Production runs on real Entra ID.

2. Design system

Element	Specification
Primary color	EMC cyan gradient #09B9E9 to #01FFFF (actions, active states, punch)
Neutrals	Black #000000, white #FFFFFF; dark UI surfaces as shown
Typography	Roboto (body and headers). Transducer Extended is the EMC display face for headers where licensed; Roboto is the fallback used here.
Icons	Thinline / outline style (per EMC brand guide)
App name	EMC People Platform
Navigation	Bottom tab bar (Home, Attendance, Leave, More). Top bar on every screen: logo taps to Home; a back chevron appears when drilled in and returns to the previous screen.

Two security-critical interaction rules

- Bank / IBAN is a verified change, not a silent edit.** Low-sensitivity profile fields (phone, emergency contact, address) save directly. Changing bank details is a payroll-redirection risk: it must route through a verification and approval path, never take effect immediately.
- The AI assistant (Tier 3) confirms before acting.** It interprets intent and pre-fills, but every action commits through the same authenticated endpoints with server-side authorization. It carries no authority of its own and must never become a parallel path that bypasses enforcement.

3. Tier 1 + Tier 2 - the app to build

These are the screens to deliver working in the two-week window. Renders are from the clickable prototype.

Sign in [BUILD NOW](#)
Entra ID single sign-on. No separate password.

Register device [BUILD NOW](#)
Links the device so punches are attributed to the employee.

Permissions [BUILD NOW](#)
Location, biometric, notifications - each optional, consent-based (PDPL).

Home [BUILD NOW](#)

Punch primacy. Today summary, leave balance, attention items.

Punch - checked in [BUILD NOW](#)

Location checked at punch, on-device biometric, live state.

Attendance [BUILD NOW](#)

Records with status pills: open, missing, flagged, complete.

Day detail [BUILD NOW](#)

Exception view for a missing punch, with correction entry.

Request correction [BUILD NOW](#)

Routed to line manager. Server-enforced authority.

Leave [BUILD NOW](#)

Balances and recent requests with status.

Request leave [BUILD NOW](#)

Whole-day / half-day / hours. Routes to manager.

Notifications [BUILD NOW](#)

Deep-link to the request; never token-bearing authority.

More [BUILD NOW](#)

Profile, preferences, privacy, help, sign out.

Profile (edit) [BUILD NOW](#)
Low-sensitivity fields inline; bank/IBAN = verified change.

Privacy & location [BUILD NOW](#)
Plain-language PDPL statement.

4. Tier 3 - future phase (design reference only)

Designed direction for stakeholders. Do not build backend for these during the two-week window. Each needs its own specification, especially the items that expose payroll data and the agentic assistant.

Roadmap menu FUTURE · DESIGN ONLY
Future-phase index. Design only.

Payslips FUTURE · DESIGN ONLY
YTD summary plus monthly payslips.

Payslip detail FUTURE · DESIGN ONLY
Earnings, deductions (GPSSA), net.

Documents FUTURE · DESIGN ONLY
Browse by category.

Request a document FUTURE · DESIGN ONLY
Salary certificate / letter request to HR.

Directory FUTURE · DESIGN ONLY
Searchable people directory.

Org chart FUTURE · DESIGN ONLY
Reporting hierarchy, expand/collapse.

Person card FUTURE · DESIGN ONLY
Contact and reporting line.

Manager approvals FUTURE · DESIGN ONLY
Pending / Decided queue.

Leave approval FUTURE · DESIGN ONLY

Context: balance, coverage, reason.

Correction approval FUTURE · DESIGN ONLY

Before/after the requested change.

AI assistant FUTURE · DESIGN ONLY

Voice/agentic. Confirm-before-act, authenticated endpoints only.

5. Build notes

Area	What to honor
Punch	Location is checked at the moment of punch only (not tracked continuously). On-device biometric; the image never leaves the device, only the match result is sent. Show all states: checking, on-site, off-site block, off-site flag, no-connectivity error.
Leave	Whole-day, half-day, and hours. Routes to the line manager via the existing workflow engine. Status reflects the server decision.
Corrections	Submitted against a specific day's exception; routes to manager. The day's status moves from Missing to Requested on submit.
Notifications	Deep-link into the authenticated request. Action happens inside the app, server re-checks authority.
Entity scope	The backend already enforces entity-scope (EMC / PRF / CHP). The app shows whatever the authenticated user is entitled to; it does not widen scope.
Connectivity	Punch is a real-time, server-acknowledged transaction. It must NOT queue offline or sync later. The server stamps the authoritative time on receipt. With no connectivity the punch does not happen: show a clear error and have the user retry once back online. A device-held, later-synced punch would make the device the source of truth for when and where the punch occurred, which is forgeable and is not permitted.

Acceptance: a working Tier 1 + Tier 2 app, signing in via Entra ID, performing punch / leave / correction against v1.9.0, with the security rules above intact. The clickable HTML prototype is the definitive visual and interaction reference and accompanies this document.

EMC People Platform - Mobile App design specification. Companion to the clickable prototype ([emc-people-mobile-prototype.html](#)). Tier 3 screens are design-only.
